

Time Elements Character Core Set | Top Down Sprite Maker sprite style setup guide

Thank you for buying the Time Elements Character Core Set asset pack.

Requirements

This guide assumes that you also own and are intending to use the pixel art character creation program [Top Down Sprite Maker](#) – which is the premium generator supported by this asset pack – to customize your characters and export your sprite sheets.

If not, you can find the art assets and the default generator program in the ZIP that is listed as the primary download option for this asset pack where you purchased it.

Instructions

1 – Extract downloaded ZIP file contents to new folder

Extract/unzip the ZIP file that contains this README to a folder of your choice on your computer.

Once you have, this new folder should contain this README file and another ZIP file called `elements_tdsm_style.zip`. This inner ZIP file is the *Top Down Sprite Maker* sprite style.

2 – Open *Top Down Sprite Maker* and upload `elements_tdsm_style.zip`

Open *Top Down Sprite Maker*.

On the main menu, click on **Start editing** to go to the customization page. Click the  (+) icon to bring up the file dialog window. Navigate to the folder you chose for the extracted ZIP contents and select `elements_tdsm_style.zip`.

3 – Customize

The sprite style should now be loaded into *Top Down Sprite Maker*. Use the options in the right panel to customize your character. You can preview any of the various animations by selecting it from the animation dropdown. You can turn your character in the preview panel by clicking the curved arrows on either side of the preview.

4 – Configure

Once you have customized your character to your liking, click the **Configure... >** button in the bottom-right corner to proceed to the configuration page.

Here, you can configure your exported sprite sheet to suit your needs.

The **Padding** section lets you pad or crop individual sprites/frames of your sprite sheet to your desired pixel size and spacing. If you wish to crop rather than pad, simply type negative numbers into the pixel textboxes with an initial " - ".

The **Sequencing** section lets you choose which directions and animations you wish to include in your exported sprite sheet, and in which order. To exclude a direction or animation, uncheck its checkbox. To reorder them, click and drag the three vertical bars to the right of each entry.

The **Sprite sheet layout** section lets you choose how you want frames arranged in the sprite sheet.

5 – Export

Once you are ready to export your sprite sheet, advance to the export page.

The exported sprite sheet will automatically have .png added to it; don't include it in the file name textbox.

To save your customization, configuration, and sprite metadata, check the **Export JSON** checkbox before exporting. This will allow you to load your customized sprite back into *Top Down Sprite Maker* during a future session by clicking the  (curly braces) icon on the customization page.

Help

If you need additional help or encounter a technical issue, please email the developer of *Top Down Sprite Maker* at jordanbunkework@gmail.com.
